COMMON CENTS · FINANCIAL FORECAST

Priya's next 12 months

Second-year student on a maintenance loan

Prepared 07 November 2026
Based on 18 months of transactions
1,000 simulated futures

There's a 100% chance you go below £0 before your next payment (Student Finance England, 12 Jan).

Answer to your biggest worry: Running out of money before payday

BALANCE TODAY	IN 30 DAYS	IN 90 DAYS	HARDSHIP RISK
£420	**–£175**	**£89**	**12%** LOW
Overdraft limit £1,500 · savings £150	likely –£330 to –£51 · High confidence (91%)	likely –£238 to £364 · High confidence (84%)	High confidence · £200 more savings → 9%

Your balance: last 3 months and next 12 months

Actual balance · Most likely forecast · Likely range (8 in 10 futures fall here) · Forecast without your life changes · Overdraft limit

How to read this: the dark line is what actually happened. The blue line is the most likely path from today; the shaded band shows where your balance lands in 8 out of 10 simulated futures. The wider the band, the less certain the forecast. Below £0 is expected around **01 December 2026**.

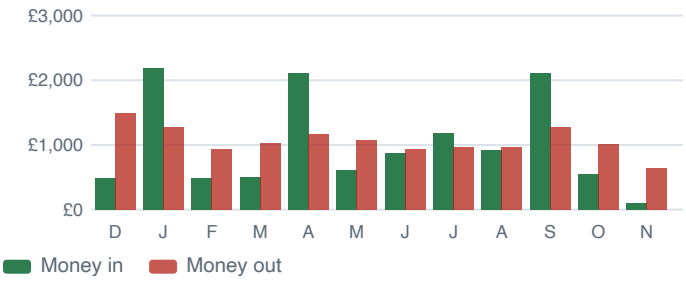

What's driving your risk

- Savings would cover 0.6 months of spending
- Savings haven't grown in 6 months
- You'd cover a £500 surprise bill with your overdraft

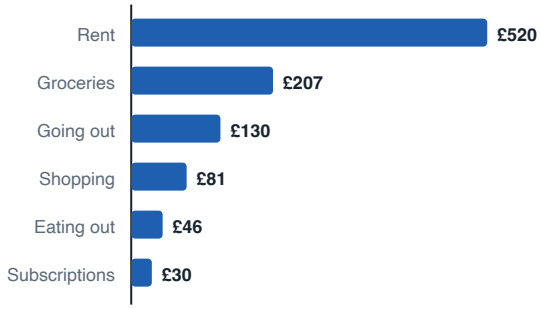

Planned life changes

- **Graduation** from 01 Jul 2027: £1,700 of student loan payments stop.
  Assumption: Student loan payments stop after graduation in July.

Income vs spending, last 12 months

Where your money goes (per month)

COMMON CENTS · FINANCIAL FORECAST

What could happen, and what you can do

Priya · 07 November 2026

Your alerts

RISK · HIGH CONFIDENCE

Rent may take you into your overdraft

Your £520 Unite Students rent on 1 December is likely to take your balance below £0, to around -£134. It's very likely you'll stay overdrawn until your Student Finance England payment of £1,650 on 12 January.

Why am I seeing this? Our forecast shows a 99% chance of going below £0 within 30 days, with a median date of 1 December, and only a 1% chance of going past your overdraft limit in the next 90 days.

Try: Check whether your overdraft is interest-free as a student, so you know what being overdrawn until 12 January will cost.

FORECAST · HIGH CONFIDENCE

Your safe-to-spend until 12 January

To stay within your £1,500 overdraft until 12 January, try to keep everyday spending under £21 a day. You usually spend about £16 a day, so you have some room, but December spending last year was about £484 higher than a typical month.

Why am I seeing this? Safe-to-spend within your overdraft is £21.21 a day over the 65 days to your next Student Finance payment, compared with your typical £15.98 a day. Last December you spent £387 to £580 more than usual.

Try: Try a 48-hour wait before any non-essential buy over £30, especially in December.

RESILIENCE · HIGH CONFIDENCE

Two changes that cut your days overdrawn

Spending half as much on going out (about £65 a month) could cut your expected days overdrawn from about 61 to 50. Halving shopping as well (about £40 a month) could bring it down to about 43 days and lift your lowest expected balance from -£1,006 to -£794.

Why am I seeing this? Our action plan tested these changes over the next 120 days across simulated futures. We also noticed that in the 3 days after money comes in, non-essential spending is about 8.3 times your usual.

Try: When your loan arrives on 12 January, move your going-out and shopping money into a separate pot so your main account just covers bills.

OPPORTUNITY · MEDIUM CONFIDENCE

Turn your loan into a weekly allowance

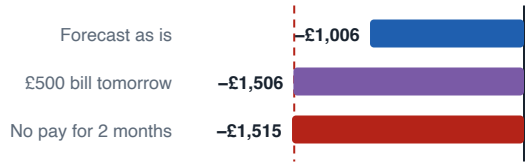

Your income comes in large lumps, which can make it hard to pace spending. Moving each loan payment into your £150 Easy Saver and paying yourself a set amount each week could help it last and start your savings goal.

Why am I seeing this? Your income arrives a few times a year, your savings haven't grown in 6 months, and they would cover about 0.6 months of spending against a target of £3,120.

Try: On 12 January, move the £1,650 to your Easy Saver and set up a weekly transfer back, dividing it by the weeks until your next payment.

Written by Claude from the forecast data above.

Stress tests: lowest expected balance

SCENARIO (NEXT 90 DAYS)	BELOW £0	PAST OVERDRAFT
Forecast as is	100%	1%
£500 bill tomorrow	100%	53%
No pay for 2 months	100%	63%

YOUR GOAL: BUILD SAVINGS

Saving £25 a month gets you to £3,120 in 119 months.

Target: 3 months of spending as an emergency fund

Your answers: Build savings · Running out of money before payday · Graduation · £500 bill: Overdraft

COMMON CENTS · FINANCIAL FORECAST

Coming up, and ways to get ahead

Priya · 07 November 2026

Coming up: bills and spending spikes we expect

WHEN	WHAT	EXPECTED COST	CONFIDENCE	WHY WE THINK SO
December 2026	**Seasonal spending increase**	£387–£580	High	Your December spending was about £484 higher than a typical month last year
January 2027	**Seasonal spending increase**	£178–£267	High	Your January spending was about £223 higher than a typical month last year
31 Dec – 28 Jan 2027	**Travel pass** 16-25 Railcard	£29–£35	Medium	You paid 16-25 Railcard £30 around this time last year
April 2027	**Seasonal spending increase**	£116–£173	High	Your April spending was about £144 higher than a typical month last year
11 Sep – 09 Oct 2027	**Education costs** Blackwell's Books	£81–£99	High	You paid Blackwell's Books £85 around this time last year

How this forecast was made. We found your regular income and bills from payment patterns, then simulated 1,000 possible futures, drawing day-to-day spending from your own history with seasonal effects (for example Christmas) and inflation. Risk scores combine the forecast with trends in your overdraft use, savings, income and bills; every factor is listed above. Economic figures and life-event costs are estimates and are listed in the data.

COMMON CENTS · FINANCIAL FORECAST

Your plan

Priya · 07 November 2026

Smallest changes with the biggest effect

1. **Spend 50% less on going out (about £65 a month)**
   (harder · lowest balance then –£875)
2. **Spend 50% less on shopping (about £40 a month)**
   (harder · lowest balance then –£794)
3. **Spend 50% less on eating out (about £23 a month)**
   (harder · lowest balance then –£748)

NEXT 120 DAYS	NOW	WITH THE PLAN
Lowest expected balance	–£1,006	**–£748**
Days overdrawn (expected)	61	**40**
Chance of going past overdraft	1%	**0%**

Greedy search over 1,000 simulated futures: each round adds the change with the biggest risk reduction per unit of effort.

SAFE TO SPEND

£21 a day

Staying above £0 until 12 Jan isn't likely. To stay within your £1,500 overdraft, keep everyday spending under £21 a day (you usually spend £16).

Next few days of bills and income

DATE	WHO	AMOUNT	BALANCE AFTER
Fri 13 Nov	SU Bar Payroll	+£102	£482
Sun 15 Nov	Spotify	–£7	£429
Fri 20 Nov	SU Bar Payroll	+£102	£469
Fri 20 Nov	Three Mobile	–£15	£469
Fri 27 Nov	SU Bar Payroll	+£102	£475
Tue 01 Dec	Unite Students	–£520	–£134

Spending patterns we noticed

- In the 3 days after money comes in, you spend about 8.3× your usual on non-essentials.
- 6 days in the last 6 months had unusually high non-essential spending (£480 in total).

For your stage of life (student)

- Check when your interest-free student overdraft ends after graduation, and plan to clear it before then.
- Treat each loan payment as money for the whole term: divide it by the weeks until the next one.

Support you asked for

I struggle with impulse spending (you asked)

We show your safe-to-spend amount and flag spending bursts after payday.

- Try a 48-hour wait before non-essential buys over £30
- Move fun money into a separate pot on payday, so the main account only covers bills
- Remove saved cards from shopping apps

Support preferences only change how information is shown. They are never used in any score or shared.

HOW ACCURATE IS THIS FORECAST?

Tested on 3 past periods: average error £290 vs £446 for the best simple guess (35% better). The 80% range contained the real balance 56% of the time.

Risk model: gradient-boosted trees trained on 1,744 simulated customers. On 582 customers it never saw, it ranked risk correctly 95% of the time (ROC-AUC 0.949), compared with 88% for a hand-written formula. **Forecast ranges** are checked by a learned model with conformal calibration: on unseen customers the 90-day 80% range held the real balance 80% of the time (simulation alone: 49%).

We re-ran the model as if it were 60, 90, 120 days ago and compared it with what really happened. Measured on the demo data, which is synthetic.
